What is claimed is:

```
1
              A method for updating coefficients in a decision
2
    feedback equalizer with an ISI canceller for canceling ISI
3
    from a plurality of first signals received from a channel,
 4
    the method comprising:
5
         decoding a first symbol comprising a set of the first
 6
               signals to generate a decoded symbol, wherein the
7
               first symbol has (k+1) chips, and k is natural
8
               number;
9
         obtaining a vector of error values computed as
10
               difference between the decoded symbol, and the
11
               first symbol;
         generating a temp matrix according to the decoded
12
13
               symbol and the vector of the error values;
14
         averaging the values of the elements in every diagonal
15
               line of the temp matrix to generate a Toeplitz
16
               Matrix; and
17
         updating the coefficients by the Toeplitz Matrix.
1
         2.
              The
                    method
                            as
                                 claimed in
                                               claim
                                                       1
2
    comprises:
 3
         updating coefficients according to a least mean square
 4
               algorithm:
         H(m+1) = H(m) + \mu T \{conj(E(m)) \cdot C(m+1)\};
 5
 6
         H(m) is coefficients at a symbol time m;
 7
         H(m+1) is coefficients at a symbol time (m+1);
 8
         i is a predetermined gain;
 9
         T is the Toeplitz Matrix;
10
         E(m) is the vector of error values; and
```

- 11 C(m+1) is the decoded symbol at the symbol time (m+1).
 - 1 3. The method as claimed in claim 1, wherein, in the

- 3 (k+1), the $h_{(i)}...h_{(2k+1)}$ are equal to 0.
- 1 4. A method for updating coefficients in a decision
- 2 feedback equalizer with an ISI canceller for canceling ISI
 - from a plurality of first signals received from a channel,
- 4 the method comprising:
- 5 decoding a first symbol comprising a set of the first
- signals to generate a decoded symbol, wherein the
- 7 first symbol has (k+1) chips, and k is natural
- 8 number;

3

- 9 obtaining a vector of error values computed as the
- 10 difference between the decoded symbol, and the
- first symbol;
- generating a temp Matrix T(m) according to the decoded
- 13 symbol and the vector of the error values,
- 14 wherein T(m) =

$$\begin{bmatrix} E^{*}(n-k)\cdot C(n-k) & E^{*}(n-k)\cdot C(n-(k-1)) & \cdots & \cdots & E^{*}(n-k)\cdot C(n) \\ E^{*}(n-(k-1))\cdot C(n-k) & E^{*}(n-(k-1))\cdot C(n-(k-1)) & \cdots & \cdots & E^{*}(n-(k-1))\cdot C(n) \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ E^{*}(n-1)\cdot C(n-k)) & E^{*}(n-1)\cdot C(n-(k-1)) & \cdots & \cdots & E^{*}(n-1)\cdot C(n) \\ E^{*}(n)\cdot C(n-k) & E^{*}(n)\cdot C(n-(k-1)) & \cdots & \cdots & E^{*}(n)\cdot C(n) \end{bmatrix}'$$

- where m is the symbol time of the first symbol,
- the chip times of the first symbol are from (n-k)

```
to n, n and m are natural numbers and n=(k+1)m;
18
19
                                E(n) is a vector of error values at the chip time
20
                                n; and C(n) is the chip of the decoded symbol at
21
                                the chip time n;
22
                     averaging the values of the elements in every diagonal
23
                                line of the temp matrix to generate a Toeplitz
                                \text{Matrix} \begin{bmatrix} h_{(k+1)} & h_{(k+2)} & \cdots & \cdots & h_{(2k+1)} \\ h_k & h_{(k+1)} & \cdots & \cdots & h_{2k} \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ h_2 & h_3 & \cdots & \cdots & h_{(k+2)} \\ h_1 & h_2 & \cdots & \cdots & h_{(k+1)} \end{bmatrix} \text{, wherein } \mathbf{H}(\mathbf{m}) = \mathbf{m} 
24
                                  \begin{bmatrix} (\sum_{i=0}^k E^i(n-i) \cdot C(n-i))'(k+l) & (\sum_{i=0}^{k-l} E^i(n-(i+l)) \cdot C(n-i))k & \cdots & E^i(n-k) \cdot C(n) \\ (\sum_{i=0}^{k-l} E^i(n-i) \cdot C(n-(i+l))k & (\sum_{i=0}^k E^i(n-i) \cdot C(n-i))'(k+l) & \cdots & (\sum_{i=0}^{k-(k-l)} E^i(n-(i+k-l)) \cdot C(n-i))'2 \\ \vdots & \vdots & \vdots & \vdots \\ (\sum_{i=0}^{k-(k-l)} E^i(n-i) \cdot C(n-(i+k-l)))'2 & (\sum_{i=0}^{k-(k-l)} E^i(n-i) \cdot C(n-(i+k-2)))'3 & \cdots & (\sum_{i=0}^{k-l} E^i(n-(i+l)) \cdot C(n-i))k \\ E^i(n) \cdot C(n-k) & (\sum_{i=0}^{k-(k-l)} E^i(n-i) \cdot C(n-(i+k-l)))'2 & \cdots & (\sum_{i=0}^{k-l} E^i(n-i) \cdot C(n-i))'(k+l) \end{bmatrix} 
25
26
                                where H(m) is the Toeplitz Matrix at the symbol
27
                                time m.
  1
                    5.
                                           method as
                               The
                                                                       claimed in
                                                                                                      claim 4
                                                                                                                              further
  2
         comprises:
  3
                    updating coefficients according to a least mean square
  4
                                algorithm:
  5
                    H(m+1) = H(m) + \mu T \{conj(E(m)) \cdot C(m+1)\};
  6
                    H(m) is coefficients at a symbol time m;
  7
                    H(m+1) is coefficients at a symbol time (m+1);
  8
                    ì is a predetermined gain;
                    T is the Toeplitz Matrix;
  9
```
